

SWITCH WINTERIZATION

Winter is coming and your track cleaners are hard at work. Unfortunately, track cleaners aren't effective for switches. This can be a serious problem - when clogged switches are covered in ice they may fail to align properly. Even worse, without the necessary cleaning these critical spots may represent a slipping hazard for your employees, particularly during inclement weather.

To make your switches safe and ready for winter, you need the power of Hulcher Services' air excavation service, featuring the Air Spade® and vacuum truck combination.

The Air Spade® / vacuum truck combo winterizes switches more effectively than any other method. The Air Spade® uses high-pressure air to loosen even the most stubborn leaves, sticks, grease, spill residue and other debris from your switch points. Once the debris is loosened from the track, our hi-rail vacuum truck picks it up quickly, leaving the switch clean and ready for the coming weather.

Hulcher's air excavation service is perfect for winterizing all the switches in your yard or for hitting the tough spots that need attention the most. Our professionals can perform this service on their own or in tandem with your roadway crews to winterize your busy rail yard quickly, with minimal impact to your operations.

Now is the time to make sure your switches are ready for winter. Let Hulcher's air excavation service clean your switches before the first snowstorm hits!
